

Abstract

A new method for freshening air by providing an unlimited variety of, and instantly changeable scents including all standard and all possible combinations of scents, disinfectant scents and like solutions, and aroma therapy scents. Comprising: a base unit having slots for holding at least one cartridge per slot and various attaching methods on said base unit for attachment to air vents of all types and non-conductive, permanent or foldable, plastic prongs on said base unit to insert into electrical outlets for alternate mounting, and an adhesive patch on said base unit providing extra support in said vents, electrical outlets, or mounting configurations of all types. Further, a non-electric, manual, scent delivery method. Comprising: replaceable, self-contained, non-pressurized, scent cartridges with removable, atomizing, pump tops to be contained within the base unit. This proposed scent delivery system has no mechanically moving parts, no electrical requirement of any kind, is inexpensive to manufacture and sell, and no scent waste of any kind. Also, since this proposed scent delivery system is completely installable, removable, storable, and serviceable by any operator; thus solving many deficiencies that until now, have not been addressed in one, inexpensive unit.
